

Time: 12:30-3 PM

Name: Sarah Abumandil

Student ID: 220223416

Part 1:

You receive the following project request on Upwork:

"We are looking for an AI student to develop an AI chatbot that answers frequently asked questions (FAQs) for our company. The project should be completed remotely within two weeks."

As a professional freelancer, prepare a project plan by completing the following tasks:

1. Write eight professional questions you would ask the client before accepting the project.

Answer:

- What platform will the chatbot live on
for example a website WhatsApp or Facebook Messenger
- Where is the FAQ data stored right now
for example a Word document a PDF or a website link
- How many total FAQs does the chatbot need to learn
- What language or languages should the chatbot understand and speak
- Do you need a history log to see what users ask the chatbot
- Will the chatbot need to connect to other tools such as a CRM or email system
- How will we know the chatbot is successful
for example a target of ninety percent correct answers
- Who will test the chatbot from your team and give feedback

2. Define the project's expected deliverables.

Answer:

- Chatbot architecture design : a simple map showing how data flows from the user to the AI system
- Trained AI model or prototype: the functional chatbot loaded with the company's FAQ data
- Integration code or widget: the clean code or script used to embed the chatbot onto the client's platform
- Handover and maintenance document: a basic guide explaining how the client can add new FAQs in the future

3. Divide the project into three logical milestones.

Answer:

- Milestone 1, Data Preparation and Design, Days 1 to 4: collect the FAQs, clean the text, choose the right AI prompt style. Payment: thirty percent of the budget
 - Milestone 2, Development and Internal Testing, Days 5 to 10: build the chatbot, connect the data, test it with more than fifty sample questions. Payment: fifty percent of the budget
 - Milestone 3, Deployment, Client Review and Handover, Days 11 to 14: launch the chatbot, fix final bugs, send documentation. Payment: twenty percent of the budget
4. Select four digital tools you would use during the project and explain why each tool is appropriate.

Answer:

- Trello or Asana, for project management: a simple visual board so the client sees progress instantly without asking for updates
- Slack or WhatsApp Business, for communication: separates project chat from personal messages and works across time zones

- **GitHub**, for version control and code sharing: safely stores the chatbot code so mistakes can be reversed
- **Voiceflow or the OpenAI API Playground**, for AI development: allows quick building and testing of AI chat agents without complex infrastructure

Part 2:

Imagine you start your remote workday with the following tasks: 25 unread emails, meeting notes, a project proposal, a LinkedIn post, a weekly progress report, and customer questions.

Design a productivity workflow that includes:

5. The **order in which you would complete these tasks**, and **which AI tool(s) you would use for each task**, and **which tasks require human review before submission**.

Answer:

1	Customer questions	Zendesk AI or ChatGPT	Yes, mandatory	Protects business reputation, errors here can lose customers
2	25 unread emails	Shortwave or Copilot	Yes, quick review	Ensures AI understood context and tone before sending
3	Meeting notes	Otter.ai or Fathom	No, personal use only	Only for personal records, a quick glance is enough
4	Weekly progress report	ClickUp AI or Notion AI	Yes, verification	Data and metrics must be checked for accuracy
5	Project proposal	Claude or ChatGPT	Yes, heavy review	Requires human strategy, pricing approval, complex logic
6	LinkedIn post	Jasper or Claude	Yes, editing	AI writing sounds generic, needs a personal voice

6. **Three risks of relying completely on AI.**

Answer:

- **Hallucinations, or fake information**: AI can confidently invent incorrect facts or statistics that look real
 - **Loss of personal or brand voice**: relying completely on AI makes writing sound generic and similar to competitors
 - **Data privacy violations**: pasting confidential client data into public AI tools can leak private information
7. **Three best practices for using AI responsibly** in professional work.

Answer:

- **The human in the loop rule**: never let AI send, publish, or submit anything automatically without human approval
- **Contextual prompting**: give clear context, audience, and tone in every prompt
- **Fact checking data sources**: treat AI output like a draft from an intern and verify all facts and numbers

Part 3:

You have completed an AI project at university and want to use it to attract remote job opportunities.

Prepare a practical branding strategy that includes:

8. How you would **present the project on GitHub**.

Answer:

- **Interactive README file** with a short demo showing the AI model working
- **One click deployment link** using Streamlit Community Cloud or Hugging Face Spaces
- **Clean code architecture** with folders for source, data, and notebooks, plus a requirements file
- **Comprehensive documentation** explaining preprocessing, model architecture, and evaluation metrics

9. How you would **present it on LinkedIn**.

Answer:

- Pin a demo video or slide deck in the **Featured section**
- Link the project to the university **education entry with relevant keywords**

- Tag **specific skills** such as Python, prompt engineering, and large language models
 - Write a result oriented description focused on the problem solved, not the code
10. How you would **include it in your Portfolio Website**.

Answer:

- Use a **case study format**: Situation, Task, Action, Result
 - Embed an **interactive live demo** directly on the page
 - Add a short **behind the scenes article** about the challenges faced
 - Place a clear hire me or collaborate **call to action** near the summary
11. Write one **professional LinkedIn post** (120-150 words) promoting the project.

Answer:

I recently built a custom AI FAQ chatbot designed to help remote teams automate client support. During my university project, I noticed that businesses waste hours answering repetitive questions, so I developed an AI assistant that instantly reads internal company documents and provides accurate answers. Key features include instant answers with almost no delay, smart data reading that pulls information directly from PDF and Word files, and high accuracy, reaching a ninety four percent correct response rate during evaluation. The project was built using Python, the OpenAI API, and Streamlit, designed to be fully scalable and ready for real use. The complete code, documentation, and a live interactive demo are available on my **GitHub** profile. I am currently open to remote AI development roles, and I would be glad to connect.

12. Write one **AI prompt** that could help you improve this post.

Answer:

Act as an expert technical copywriter and remote recruiter. Review the LinkedIn post below and optimize it to maximize **engagement** from remote engineering managers. Keep the tone professional yet energetic, keep the length between one hundred twenty and one hundred fifty words, and focus on demonstrating business value, problem solving ability, and clean technical skills. Insert the draft post here.

13. Explain what parts of the AI-generated content should always be **reviewed manually**.

Answer:

- **Technical metrics**: confirm the AI did not change or invent accuracy percentages or dataset sizes
- **Personal authenticity**: remove generic AI phrases and keep a genuine personal voice
- **Link functionality**: check that GitHub, portfolio, and demo links actually work

Part 4:

You have launched an online AI service that automatically summarizes business documents.

Design a 7-day digital marketing campaign that includes:

14. Your **target audience**.

Answer:

- Primary: busy operations managers, project managers, and executive assistants
 - Secondary: remote researchers, consultants, and startup founders
 - Pain points: information overload, hours wasted reading long documents, missed deadlines
15. **Three marketing objectives**.

Answer:

- **Awareness**: reach five thousand impressions across target platforms
 - **Engagement**: achieve a four percent **click through rate** on links to the tool
 - **Acquisition**: convert one hundred fifty users to sign up during the launch week
16. A **content schedule for seven days**, the platform(s) used for each post, and the type of content published each day.

Answer:

Day 1	LinkedIn	Text and image	Highlight the pain point of wasting hours reading long reports and introduce the solution
Day 2	X (Twitter)	Short video	30 second recording showing a long PDF summarized into a few bullet points
Day 3	LinkedIn	Carousel	Educational tips on spotting the most important data in a document instantly
Day 4	X (Twitter)	Interactive poll	Ask the audience which type of document wastes most of their time
Day 5	Blog / Medium	Long article	Deep dive into how AI summarization saves teams hours every week
Day 6	LinkedIn and X	Testimonial	Share a quote or case study from an early tester praising accuracy and time saved
Day 7	All platforms	Call to action	Launch week offer, sign up and get first documents summarized free

17. Three **Key Performance Indicators (KPIs)** you would use to evaluate the campaign.

Answer:

- **Impressions and reach:** total number of people who saw the campaign
- **Click through rate:** percentage of viewers who clicked the link
- **Sign up conversion rate:** percentage of visitors who created a free trial account

18. Explain how AI can support your campaign while maintaining **ethical standards**.

Answer:

- **Content generation, not fabrication:** use AI to brainstorm and write, never to fake testimonials or metrics
- **Data privacy boundaries:** never feed confidential client data into public AI tools for case studies
- **Transparent capabilities:** clearly state what the tool can and cannot do, avoid overstating it

Part 5:

Read the following scenario carefully. You are working remotely for an international client. During the project: the client requests additional features not in the original agreement, the deadline is seven days away, the client stops replying for two days, part of the provided data is incomplete, and you still need to maintain a professional relationship with the client.

Prepare a professional action plan that explains:

19. How you would **organize and prioritize your remaining work**.

Answer:

- **Freeze incomplete sections:** pause work on features affected by missing data
- **Lock the original scope:** focus all hours on the already agreed, complete features
- **Create a visible blocked list:** mark affected tasks clearly on the project board

20. How you would **communicate with the client professionally**.

Answer:

Send one clear, calm message. Example: Subject, Project Status Update and Action Required. Hi, I hope you are having a great week. As we are exactly seven days away from our final deadline, I want to share a quick update and get your guidance on a few items. First, regarding the original scope, we are completely on track. Second, regarding the new feature requests, I would be glad to build them, and to keep our launch date safe we can build them as a second phase right after this week's delivery. Third, regarding the data dependency, we need the missing fields to finish that module. Could we schedule a short ten minute review call, or simply reply with the missing data fields to keep us on schedule. Best regards.

21. Which **digital collaboration tools** you would use.

Answer:

- **Notion or ClickUp:** shared dashboard, tag the client in missing data task cards for automatic notifications
- **Loom:** short screen recording showing the completed work and the exact missing fields

22. Which **AI tools** could help you complete the project more efficiently.

Answer:

- **Claude or ChatGPT**: clean and restructure incomplete data tables quickly
- **GitHub Copilot**: generate repetitive testing code faster during the final week

23. How you would **negotiate the additional work**.

Answer:

- **The yes and strategy**: agree to build the feature, offer either extending the deadline or treating it as a paid second milestone
- **Let the numbers** speak: show a clear breakdown of the extra time and budget required

24. How you would ensure **quality before delivery**.

Answer:

- **Automated core testing** to confirm the main functions still work
- **Edge case checks with difficult inputs** to confirm the system fails gracefully
- A **clean handoff package** with code, data, and a quick start guide

25. How you could transform this successful project into **future freelance opportunities** and **strengthen your professional brand**.

Answer:

- Propose a **monthly maintenance retainer** for ongoing support after launch
- Ask for a **strong client review** highlighting problem solving under a tight deadline
- Write a **case study or LinkedIn post** about managing the project successfully
