

Generative AI Career

Remote Work Midterm

Sarah Abumandil | AI & Data Science, UCAS | June 2026

Question 1 : Remote Work in Generative AI

How Can This Career Be Practiced Remotely?

Generative AI engineering is one of the best jobs you can do from home. You only need a good internet connection. You can collect data, train models, and launch your code from anywhere in the world. All the work like code notebooks and database is digital, so you just upload it online and share it with your team.

Websites like Hugging Face, GitHub, and AWS mean you do not need expensive graphics cards (GPUs) at home; everything runs in the cloud. Teams talk and work together using basic apps like Slack, Notion, and Loom, exactly like open source coders do. It is super easy to work remotely.

The Most Beneficial Digital Platforms

Development & Collaboration

- **GitHub:** The place where you save your code, check your team's work, and show off your projects to get hired
- **Hugging Face:** A huge website for AI where you download ready made models, find data, and show live demos of your work
- **Colab / Kaggle:** Free websites by Google where you can run your AI code using their fast computers (GPUs) right from your web browser.

MLOps & Deployment

- **W&B:** A tool to track your AI tests, find the best settings, and see how your model improves over time with your team.
- **Vercel / Render:** Super easy websites to launch your apps and front ends online instantly straight from your GitHub.
- **LangSmith:** tool to monitor your AI apps, fix bugs, and see exactly how your AI agents are thinking step by step.

Freelance & Remote Employment

- **Toptal / Upwork:** Top websites to find freelance jobs, where AI developers make \$60 to \$150 an hour building smart bots and search systems
- **LinkedIn:** The main app where companies look for you; having a clean profile with your best projects pinned brings the clients in.
- **Contra / Arc.dev:** Freelance sites built just for remote coders and beginners looking to get hired fast.

Platforms were selected based on direct applicability to the Generative AI stack, remote first design, and community signal value on GitHub and Hugging Face. These tools cover the professional lifecycle of learning, building, shipping, and monetizing.

Opportunities for Remote Generative AI Professionals

- Companies in the US, EU, and Gulf need AI workers so badly because they cannot find them locally, so they are actively hiring remote people for LLM and RAG jobs.

- Working online means nobody talks at the same time, so if you write clear notes (like READMEs and guides), you win
- Sharing your free code on GitHub and Hugging Face builds your name, and nobody cares where you live or what university you went to.
- The freelance market is blowing up; clients on Upwork and Toptal are paying big money for RAG setups, custom AI code, and smart prototypes.
- Living in Palestine is cheap, but international clients pay you in strong dollars, so you make crazy good money compared to local costs.

Challenges for Remote Workers in This Field

- Training big AI models needs crazy expensive graphics cards (GPUs), but you can bypass this by getting free cloud money from Google, AWS, or Hugging Face.
- The internet in Gaza cuts off a lot, which ruins long AI training. You fix this by scheduling your work, running things in the background, and saving your progress so it can resume exactly where it stopped.
- Working with people in the US or Europe means different times, so you need to fix your schedule and write clear updates so they see them when they wake up.
- Stripe and PayPal do not really work in Palestine, so freelancers bypass this problem by getting paid through Wise, Payoneer, or crypto.
- Working alone can make you feel stuck and without a mentor, but you can fix this by jumping into online communities like Discord, Hugging Face forums, and LangChain groups to chat with other coders.

Question 2 : Professional Online Profile

Profile Overview

GitHub profile: <https://github.com/sarahabumandil> Ranked #8 of most developer active in Palestine 2026

LinkedIn: <https://linkedin.com/in/sarah-abumandil-641799329>

How the Profile Reflects Skills, Experience, and Interests

The GitHub profile currently pins four repositories that together tell a coherent story about Sarah's technical trajectory:

- Isotop-Startup = A project made with Next.js and FastAPI that proves you can build both the front and back of a website, and connect real physics math with a working app.
- HealthWise_CHD__ExpertSystemProject = An AI project built with Python that proves you can use smart logic to solve real medical problems, connecting health data with coding just like your bio
- says.rag-system-from-scratch = A project built from zero that proves you actually understand how AI search works, showing companies you are a real expert and not just someone copying pre-made tools.
- ZakeyTeam-arabic-qa-system-arabert = An Arabic AI project from a bootcamp that shows Sarah is an expert in making computers understand Arabic, which makes her stand out since very few coders can actually do this

Areas Planned for Future Development

- Taking free AI models like Mistral and LLaMA 3, training them with smart shortcuts (LoRA) on custom data, and uploading the final parts to Hugging Face so anyone can use them.
- Building a smart AI bot that can use different tools step by step, and using LangSmith to show everyone exactly how the AI thinks and fixes bugs in realtime.
- Helping fix and improve free AI tools on Hugging Face so other coders notice you, respect your work, and help you get connected to top jobs.
- Taking top AI courses from DeepLearning.AI and Hugging Face to get certificates and prove you actually know the real science behind AI.

Question 3 : AI Assisted Text Improvement

Text Improved: GitHub / LinkedIn Bio

Original version :

Artificial Intelligence | Data Science | Signal Generation & Predictive Modeling"

AI-assisted version:

"Generative AI Engineer & Data Scientist | Building RAG systems, agentic pipelines, and LLM-powered products | Open to remote collaboration"

Comparison: What Changed and Why

- **Changing your title to "Engineer & Data Scientist" instead of just listing subjects, showing companies you are a real professional worker and not just a student reading books**
- **Putting exact AI words like RAG, LLMs, and bots in your CV so corporate filters and HR search engines pick you out automatically**
- **Adding "Open to remote work" to your profile so global bosses know right away they can hire you online without any complications**

Manual Adjustments Made

The AI's suggested "NLP enthusiast" was replaced with "Engineer" to emphasize professional project delivery, and "large language model-powered software products" was shortened to "LLM-powered products" to meet platform character limits. The Arabic NLP focus was removed from the short bio, with specific details preserved within pinned repositories for better context.

Does the Text Still Reflect Sarah's Voice?

The AI only helped fix the layout and vocabulary, but all the facts are real from Sarah's actual work history. It shows she builds things from zero instead of just copying pre-made tools, which is clear in her project descriptions and files. The profile looks much stronger now, but without lying or making things up.

Question 3 (Part B) : Ethical Use of AI: Where Are the Boundaries?

Acceptable AI Assistance

- Fixing the layout and correcting typos or grammar mistakes in the text that the author already wrote
- Recommending better, punchier words and active phrasing while keeping the exact same meaning the author wanted.

- Making a clean blueprint or basic layout so the author can easily fill it in with their own real knowledge and experiences.
- Breaking down tough, new ideas so you can learn them way faster, but you are still the one doing the actual studying
- Using AI (like GitHub Copilot) to quickly fill in repetitive code and syntax, but the developer still double-checks and understands every single line.

Excessive Dependence , Where the Line Is Drawn

- Copying and pasting AI text exactly as it is for your homework or job without telling anyone is cheating, and universities call it plagiarism.
- Lying with AI by making up fake certificates, fake jobs, or fake projects is wrong, and it will ruin your entire career when you get caught.
- Letting AI do all the thinking for you when studying is useless; if you cannot explain or do the work yourself, you learned absolutely nothing
- Swapping real human mentors for AI completely is a bad idea; humans give you real-world wisdom, keep you responsible, and connect you to jobs in ways AI never can.

Personal Boundary

AI is used just like a smart helper or editor, not to do the whole job for you. You must check every single line it writes and delete anything that is not true to your real life. Give credit if AI helped layout the work, so you stay honest while still saving time.

Question 4 : Personal Development Plan

After Graduation (Jan 2027)

The goal is to get an online job as an AI or ML Engineer making bots, smart search, and training models. In a year or two, the target is a remote job with a US or European company making \$30k to \$60k a year, or making the same money freelancing on Upwork. Later on, the big dream is to start an AI company for the Arab world.

Skills That Need Development for Remote GenAI Work

- Knowing the basic science of how to train AI models using LoRA shortcuts, but needing real practice on real models like Mistral and LLaMA 3.
- Learning how to pack your code into containers using Docker, running them with basic Kubernetes, and launching AI models automatically online using GitHub Actions and Hugging Face.
- Using tools like RAGAS, TruLens, and DeepEval to test your AI search system accurately with real numbers, instead of just guessing if it works.
- Learning to work with online teams by writing clear code updates, recording quick video walkthroughs on Loom, and keeping all notes organized on Notion
- Learning how to handle freelance clients by setting project rules, writing clear contracts, and making sure everyone agrees on what work will be delivered.

Digital Platforms Planned for Use

- Hugging Face Hub : publish model adapters and Spaces demos to build community visibility.
- LangSmith : add full observability to the AlphaMind Pro agentic system and publish traces publicly.

- Weights & Biases : instrument all training runs with experiment tracking from this semester onward.
- Toptal / Upwork : target first paid freelance project by Q1 2027 after building portfolio strength.
- LinkedIn : publish monthly technical posts (project walkthroughs, lessons learned) to build organic reach.

How AI Tools Support Productivity and Communication

- GitHub Copilot for accelerating boilerplate code in FastAPI, LangChain, and data pipeline scripts.
- Claude / ChatGPT for drafting client proposals, README documentation, and technical blog post outlines.
- Perplexity AI for rapid literature review on emerging GenAI papers before deciding which techniques to implement.
- Grammarly for async written communication to ensure professional clarity in English language client interactions.

One Concrete Action This Semester

By the end of July 2026, I will launch a Hugging Face Space for my AlphaMind Pro project with a live demo, full model details, and a public LangSmith dashboard. This single move proves my portfolio, community work, and MLOps skills all at once, giving me a solid link to share on LinkedIn and job applications. I will also write a LinkedIn article explaining how I built it to attract recruiters looking for engineers who can build and explain AI systems.
